## INSTRUCTIONS FOR STUDENTS

- Questions are on both sides of the paper. This is an 9 question exam.
- Students have 1 hour and 50 minutes to complete the exam.
- The test will be out of **70 points**. The highest possible score will be **75 points**. You can attempt as many of the questions as you wish, but keep in mind you are trying to get to the **70 points**.
- In the above table, the row with the ✓, is for you to keep track of the problems you are attempting/completing.
- Higher point problems are harder, thus they are weighted more. In order to do well, you will have to attempt some of the more difficult problems.
- You may complete parts of problems, as partial credit will be given based on correctness, completeness, and ideas that are leading to the correct solutions.
- **PLEASE SHOW ALL WORK**. Any unjustified claims will receive no credit. Clearly box your final answer.
- No notes, textbooks, phones, calculators, etc. are allowed for the exam.
- The back of the test can be used for scratch work.

GOOD LUCK!

FORMULAS:

Useful Formulas	Useful Formulas
$\frac{d}{dx} \arcsin(x) = \frac{1}{\sqrt{1-x^2}} \quad  x  < 1$	$\int \frac{dx}{\sqrt{a^2-x^2}} = \arcsin\left(\frac{x}{a}\right) + C$
$\frac{d}{dx} \arccos(x) = -\frac{1}{\sqrt{1-x^2}} \quad  x  < 1$	$\int \frac{dx}{a^2+x^2} = \frac{1}{a} \arctan\left(\frac{x}{a}\right) + C$
$\frac{d}{dx} \arctan(x) = \frac{1}{1+x^2}$	$\int \frac{dx}{x\sqrt{a^2-x^2}} = \frac{1}{a} \operatorname{arcsec}\left \frac{x}{a}\right  + C$
$\sin(2\theta) = 2 \sin(\theta) \cos(\theta)$	$\cos^2(\theta) = \frac{1}{2}(1 + \cos(2\theta))$
$\sin^2(x) + \cos^2(x) = 1$	$\sin^2(\theta) = \frac{1}{2}(1 - \cos(2\theta))$

1) (10 pts.) Compute the following indefinite integral. (Note: Integrate with respect to  $t$ . Treat  $x$  as a constant. Your final answer should be a function of  $x$ , there should be no  $t$  in your answer.)

$$\int_0^x e^t \sin(x-t) dt$$

Integration by parts with respect to  $t$

$$u = \sin(x-t) \quad dv = e^t dt$$

$$du = -\cos(x-t) dt \quad v = e^t$$

$$\Rightarrow \int_0^x e^t \sin(x-t) dt = e^t \sin(x-t) \Big|_{t=0}^{t=x} - \int_0^x e^t (-\cos(x-t)) dt$$

$$= e^t \sin(x-t) \Big|_{t=0}^{t=x} + \int_0^x e^t \cos(x-t) dt$$

$$u = \cos(x-t) \quad dv = e^t dt$$

$$du = \sin(x-t) dt \quad v = e^t$$

$$= e^t \sin(x-t) \Big|_{t=0}^{t=x} + e^t \cos(x-t) \Big|_{t=0}^{t=x} - \int_0^x e^t \sin(x-t) dt$$

$$\Rightarrow 2 \int_0^x e^t \sin(x-t) dt = e^t \sin(x-t) \Big|_{t=0}^{t=x} + e^t \cos(x-t) \Big|_{t=0}^{t=x}$$

$$\Rightarrow \int_0^x e^t \sin(x-t) dt = \frac{1}{2} (0 - \sin(x-0) + e^x \cos(0) - e^0 \cos(x))$$

$$= \boxed{\frac{1}{2} (e^x - \sin(x) - \cos(x))}$$

2) (5 pts.) Compute the following indefinite integral.

$$\int \sin^5(x) \cos^4(x) dx$$

$$\int \sin^5(x) \cos^4(x) dx = \int \sin^4(x) \cos^4(x) \sin(x) dx$$

$$= \int (1 - \cos^2(x))^2 \cos^4(x) \sin(x) dx$$

$$u = \cos(x)$$

$$du = -\sin(x) dx$$

$$= \int (1 - u^2)^2 u^4 (-du)$$

$$= - \int (u^4 - 2u^2 + 1) u^4 du$$

$$= - \int (u^8 - 2u^6 + u^4) du$$

$$= - \left( \frac{u^9}{9} - \frac{2}{7} u^7 + \frac{u^5}{5} \right) + C$$

$$= \left[ -\frac{1}{9} \cos^9(x) + \frac{2}{7} \cos^7(x) - \frac{\cos^5(x)}{5} + C \right]$$

3) (10 pts.) Compute the following indefinite integral.

\* For details, see Groupwork 3  $\int \frac{x^3}{\sqrt{x^2+9}} dx$

Use  $x = 3 \tan \theta$   
 $dx = 3 \sec^2 \theta d\theta$

$$\int \frac{x^3}{\sqrt{x^2+9}} dx = \int \frac{3^3 \tan^3 \theta}{3 \sec \theta} 3 \sec^2 \theta d\theta$$

$$= 3^3 \int \tan^2 \theta \tan \theta \sec \theta d\theta$$

$$u = \sec \theta$$

$$du = \sec \theta \tan \theta d\theta$$

$$= 3^3 \int (\sec^2 \theta - 1) \tan \theta \sec \theta d\theta$$

$$= 3^3 \int (u^2 - 1) du = 3^3 \left( \frac{1}{3} u^3 - u \right) + C$$

$$= 3^3 \left( \frac{1}{3} \sec^3 \theta - \sec \theta \right) + C$$

$$= \boxed{\frac{1}{3} (x^2 + 9)^{3/2} - 9 \sqrt{x^2 + 9} + C}$$

4) (5 pts.) Compute the following indefinite integral.

$$\int \frac{1}{x^2-1} dx$$

$$\int \frac{1}{x^2-1} dx = \int \frac{1}{(x+1)(x-1)} dx$$

$$= \int \left( \frac{-\frac{1}{2}}{x+1} + \frac{\frac{1}{2}}{x-1} \right) dx$$

$$= -\frac{1}{2} \int \frac{1}{x+1} dx + \frac{1}{2} \int \frac{1}{x-1} dx$$

$$= -\frac{1}{2} \ln|x+1| + \frac{1}{2} \ln|x-1| + C$$

$$\frac{1}{(x+1)(x-1)} = \frac{A}{x+1} + \frac{B}{x-1}$$

$$\Rightarrow 1 = A(x-1) + B(x+1)$$

$$\text{Let } x=1 \Rightarrow 1 = 2B \Rightarrow B = \frac{1}{2}$$

$$x=-1 \Rightarrow 1 = -2A \Rightarrow A = -\frac{1}{2}$$

$$\text{So } \frac{1}{(x+1)(x-1)} = \frac{-\frac{1}{2}}{x+1} + \frac{\frac{1}{2}}{x-1}$$

- 5) (5 pts.) (a) Determine whether the integral is convergent or divergent:  $\int_1^{\infty} \frac{\ln x}{x} dx$   
 (5 pts.) (b) Determine whether the integral is convergent or divergent:  $\int_e^{\infty} \frac{1}{x(\ln x)^2} dx$

$$a) \int_1^{\infty} \frac{\ln(x)}{x} dx = \lim_{t \rightarrow \infty} \int_1^t \frac{\ln(x)}{x} dx$$

$$= \lim_{t \rightarrow \infty} \int_0^{\ln(t)} u du$$

$$= \lim_{t \rightarrow \infty} \left. \frac{u^2}{2} \right|_0^{\ln(t)} = \lim_{t \rightarrow \infty} \frac{(\ln(t))^2}{2} = \infty$$

$$u = \ln(x)$$

$$du = \frac{1}{x} dx$$

$\Rightarrow$  Divergent

$$b) \int_e^{\infty} \frac{1}{x(\ln(x))^2} dx = \lim_{t \rightarrow \infty} \int_e^t \frac{1}{x(\ln(x))^2} dx$$

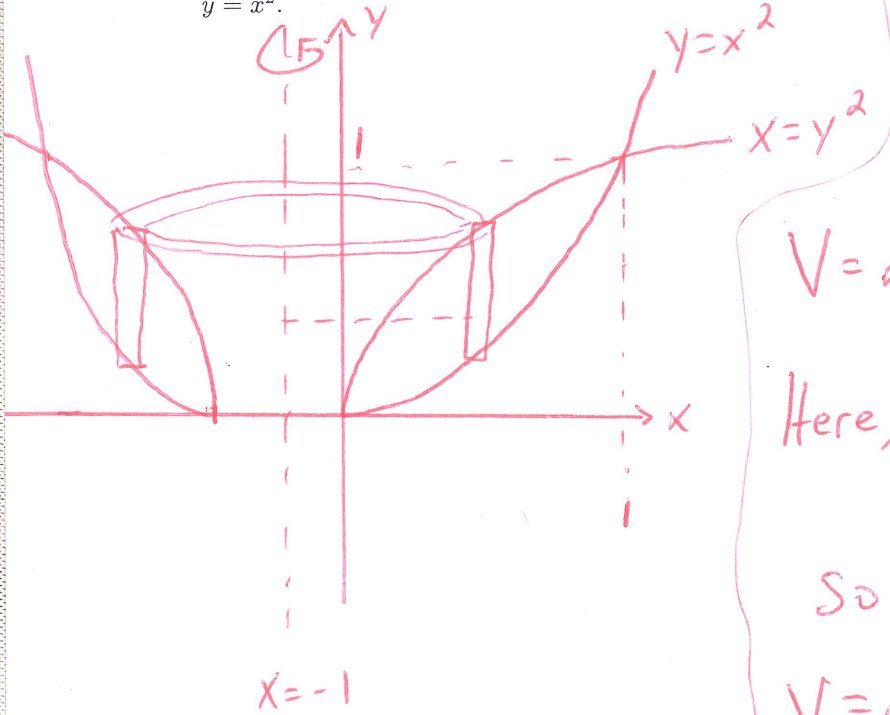

$$= \lim_{t \rightarrow \infty} \int_1^{\ln(t)} \frac{1}{u^2} du$$

$$= \lim_{t \rightarrow \infty} \left. \left( -\frac{1}{u} \right) \right|_1^{\ln(t)} = \lim_{t \rightarrow \infty} -\frac{1}{\ln(t)} - (-1)$$

$$= 0 + 1 = 1$$

$\Rightarrow$  Convergent

- 6) (10 pts.) Find the volume of the region rotated around the line  $x = -1$ , and bounded by  $x = y^2$  and  $y = x^2$ .

Use shell method

$$V = 2\pi \int_a^b (x+c)(f(x)-g(x)) dx$$

Here,  $f(x) = \sqrt{x}$  ( $x = y^2 \Rightarrow y = \sqrt{x}$  since it's top half)  
 $g(x) = x^2$

So

$$V = 2\pi \int_0^1 (x+1)[\sqrt{x} - x^2] dx$$

$$\Rightarrow V = 2\pi \int_0^1 \sqrt{x}(x+1) dx - 2\pi \int_0^1 (x+1)x^2 dx$$

$$= 2\pi \int_0^1 (x^{3/2} + x^{1/2}) dx - 2\pi \int_0^1 (x^3 + x^2) dx$$

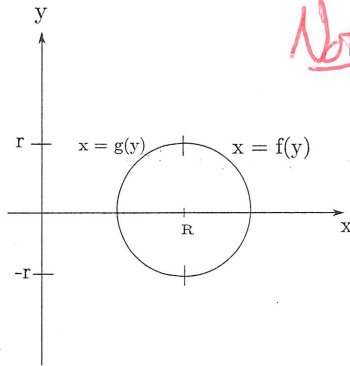

$$= 2\pi \left( \frac{2}{5} x^{5/2} + \frac{2}{3} x^{3/2} \right) \Big|_0^1 - 2\pi \left( \frac{x^4}{4} + \frac{x^3}{3} \right) \Big|_0^1$$

$$= 2\pi \left( \frac{2}{5} + \frac{2}{3} \right) - 2\pi \left( \frac{1}{4} + \frac{1}{3} \right)$$

$$= 2\pi \left( \frac{29}{60} \right) = \boxed{\frac{29}{30} \pi}$$

7) (10 pts.) The following question is designed to walk you through how to find the volume of the torus, the doughnut shaped solid pictured at the bottom of the page.

- a) (1 pts.) Write the equation of a circle with center at  $(R, 0)$  and radius  $r$ .
- b) (2 pts.) Solve the equation of the circle you found in part (a) for  $x$ . Now, using the result, write out the functions  $g(y)$  and  $f(y)$  that are given in the diagram below.
- c) (4 pts.) Integrating with respect to  $y$ , set up the integral for the volume, rotating around the  $y$ -axis. We are really doing washers from scratch. We are finding the area of the large outside disk and small inner disk. (**Hint:** Since we are integrating with respect to  $y$ , the formula is no longer top - bottom, but right - left.)
- d) (3 pts.) Do the integration and find the volume, using the answer from part (c). (**Hint:** What area is  $\int_{-r}^r \sqrt{r^2 - y^2} dy$  in the diagram below? Doing the integral directly is possible, but it is a trig-sub.)

Note: For details, see Practice Midterm Solutions #7

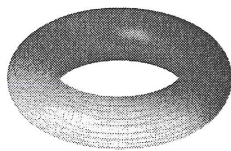

$$a) (x-R)^2 + y^2 = r^2$$

$$b) x = f(y) = R + \sqrt{r^2 - y^2}$$

$$x = g(y) = R - \sqrt{r^2 - y^2}$$

$$c) V = 4\pi R \int_{-r}^r \sqrt{r^2 - y^2} dy$$

$$d) V = 2\pi^2 r^2 R$$

8) (10 pts.) The following question is designed for you to derive the surface area of a sphere.

Find the area of the surface generated by revolving the curve  $y = \sqrt{R^2 - x^2}$ , for  $-R \leq x \leq R$  about the  $x$ -axis.

$$S = \int_{-R}^R 2\pi y \sqrt{1 + \left(\frac{dy}{dx}\right)^2} dx$$

$$y = \sqrt{R^2 - x^2} \Rightarrow \frac{dy}{dx} = \frac{-x}{\sqrt{R^2 - x^2}} \Rightarrow \left(\frac{dy}{dx}\right)^2 = \frac{x^2}{R^2 - x^2}$$

$$\Rightarrow 1 + \left(\frac{dy}{dx}\right)^2 = \frac{R^2}{R^2 - x^2}$$

$$\Rightarrow S = \int_{-R}^R 2\pi \sqrt{R^2 - x^2} \cdot \sqrt{\frac{R^2}{R^2 - x^2}} dx$$

$$= 2\pi R \int_{-R}^R dx = 2\pi R(2R) = \boxed{4\pi R^2}$$

9) (5 pts.) A particle is moved along the  $x$ -axis by a force that measures  $\frac{4}{(1+x)^3}$  pounds at a point  $x$  feet from the origin. Find the work done in moving the particle from the origin to a distance of 1 foot.

$$W = \int_a^b F(x) dx, \quad F(x) = \frac{4}{(1+x)^3}$$

$$\Rightarrow W = \int_0^1 \frac{4}{(1+x)^3} dx$$

$$= 4 \int_0^1 \frac{1}{(1+x)^3} dx$$

$$= 4 \int_1^2 \frac{1}{u^3} du$$

$$= 4 \cdot \left( -\frac{1}{2} u^{-2} \right) \Big|_1^2$$

$$= 4 \cdot \left( \frac{3}{8} \right)$$

$$= \boxed{\frac{3}{2} \text{ ft. lbs}}$$

$$u = x+1 \\ du = dx$$
