1. Show that every category with finite products can be made into a monoidal category.

Let \( C \) be a category with finite products. Then for any pair of objects \( A_1, A_2 \), there exists another object \( A \) and morphisms \( \pi_1 : A \to A_1, \pi_2 : A \to A_2 \) such that for any other object \( B \) with maps \( b_1 : B \to A_1, b_2 : B \to A_2 \) there exists a unique map \( u : B \to A \) such that commutes. If \( B \) is another product, then we have a unique \( v : A \to B \) such that commutes. Since \( u \circ v : B \to B \) is unique and \( 1_B : B \to B \) exists, then \( u \circ v = 1_B \). By symmetry, \( v \circ u = 1_A \), thus \( A \cong B \) and any product \( A_1 \times A_2 \) we choose will be isomorphic to any other.

Let \( 1 \) be an object of \( C \) such that for any object \( B \) there exists a unique map
Define $I := 1$. This is well defined up to isomorphism, since for any other choice $1'$ there exists a unique isomorphism such that

\[
\begin{array}{c}
1 \\
\vdots \\
\exists !: \\
1'
\end{array}
\]

commutes.

Define $A \otimes B := A \times B$. Now $\mathcal{C}$ is a monoidal category.

- The map

\[
\otimes : \mathcal{C} \times \mathcal{C} \to \mathcal{C} \\
(A, B) \mapsto A \otimes B \\
(f, g) \mapsto f \otimes g
\]

preserves composition, since given $f : A \to C$, $g : B \to D$, $h : C \to E$, $j : D \to F$, we have unique morphisms $f \otimes g : A \otimes B \to C \otimes D$ and $h \otimes j : C \otimes D \to E \otimes F$ such that this diagram commutes:

\[
\begin{array}{ccc}
A & \overset{\pi_1}{\leftarrow} & A \times B & \overset{\pi_2}{\rightarrow} & B \\
\downarrow f & & \cdots & & \downarrow g \\
C & \overset{\pi_1}{\leftarrow} & C \times D & \overset{\pi_2}{\rightarrow} & D \\
\downarrow h & & \cdots & & \downarrow j \\
E & \overset{\pi_1}{\leftarrow} & E \times F & \overset{\pi_2}{\rightarrow} & F
\end{array}
\]

But this diagram also commutes:

\[
\begin{array}{ccc}
A & \overset{\pi_1}{\leftarrow} & A \times B & \overset{\pi_2}{\rightarrow} & B \\
\downarrow h \circ f & & \cdots & & \downarrow (j \circ g) \\
E & \overset{\pi_1}{\leftarrow} & E \times F & \overset{\pi_2}{\rightarrow} & F
\end{array}
\]

so $(h \otimes j) \circ (f \otimes g) = (h \circ f) \otimes (j \circ g)$. Since $\otimes$ is defined for objects and morphisms and preserves composition, $\otimes$ is a functor.
• $A \cong I \otimes A$ since there exists a unique $f$ making the following commute:

![Diagram](image)

and $f \circ \pi_2 = \pi_2 \circ f = \text{id}_A$. A similar argument shows $A \cong A \otimes I$.

• The unitors $r_A : A \otimes 1 \to A = \pi_1$ and $l_A : 1 \otimes A \to A = \pi_2$ are natural isomorphisms. For $l_-$, consider the functors $\text{id}_C$ and $1 \otimes -$. Given any morphism $f : A \to B$, we have a unique morphism $\text{id}_f \otimes f : I \otimes A \to I \otimes B$ making this diagram commute:

![Diagram](image)

and similarly for $r_A$. 
A similar diagram shows there's a unique map from $A \otimes (B \otimes C)$ to $(A \otimes B) \otimes C$ with the appropriate property, so $a_{A,B,C}$ is an isomorphism.

If $a_{A,B,C}$ is a natural isomorphism, given $f : A \to D$, $g : B \to E$, and $h : C \to F$, consider the two functors $(- \otimes (-) \otimes (-)) : C^3 \to C$, and $h : C \to F$.

The associator $a_{A,B,C} : (A \otimes B) \otimes C \to A \otimes (B \otimes C)$ is the unique map making the following diagram commute:

where $\Delta : A \to A \times A$ is the unique map making the following diagram commute.
• The “triangle equation” diagram and the “pentagon equation” diagrams commute for the same reason: since there are projections mapping out of each product and any map between products is unique, any two apparent ways of mapping from one product to another while preserving the components of the product must be the same.

\[
\begin{align*}
(A \times 1) \times B & \xrightarrow{a_{A,1,B}} A \times (1 \times B) \\
\pi_1 \circ \pi_1 & \quad \exists ! \pi_A \times \text{id}_B \\
A & \xleftarrow{\pi_1} A \times B \xrightarrow{\pi_2} B
\end{align*}
\]

\[
\begin{align*}
((A \times B) \times C) \times D & \quad a_{A,B,C} \times \text{id}_D \\
A \times (B \times C) \times D & \quad a_{A,B,C} \times \text{id}_D \\
(A \times B) \times (C \times D) & \quad a_{A,B,C,\times D} \\
A \times (B \times (C \times D)) & \quad \text{id}_A \times a_{B,C,\times D}
\end{align*}
\]
