Detailed Table of Contents

Preface	1
Prerequisites	3
Set theory	3
Topology	3
Algebra.....	4
I. Foundational and geometric background	5
1. Categories and functors	5
Examples of categories	6
Functors.....	7
Examples of covariant functors	7
Contravariant functors and examples	8
Properties of functors	10
Natural transformations.....	11
Equivalences of categories	13
2. Barycentric coordinates and polyhedra	13
Affine independence and barycentric coordinates.....	13
Sets with simplicial decompositions.....	14
Decompositions of prisms	15
3. Subdivisions	18
Simple examples	18
Definition of subdivisions	19
Barycentric subdivisions	19
Diameters of barycentric subdivisions	22
II. Homotopy and cell complexes	23
1. Homotopic mappings.....	23
Special types of homotopy equivalences.....	25
Counting homotopy classes.....	26
Important standard notation.....	27
2. The fundamental group	28
3. Abstract cell complexes	28
Adjoining cells to a space	31
Cell complex structures.....	34
4. The Homotopy Extension Property.....	36

III.	Simplicial homology	39
	Some motivation from vector analysis	39
1.	Exact sequences and chain complexes	40
	Examples	41
	Graded objects	41
	Chain complexes	42
2.	Homology groups	44
3.	Homology and simplicial complexes	45
	Three definitions of simplicial homology groups	45
	Acyclic complexes	48
	The Königsberg Bridge Problem	50
4.	Comparison principles	51
	Application to simplicial complexes	52
	The Five Lemma	53
	The isomorphism theorem	53
	Application to barycentric subdivisions	56
5.	Chain homotopies	56
	An important example	57
IV.	Singular homology	59
1.	Definitions	59
	Some simple properties of homology groups	60
2.	Eilenberg-Steenrod properties	61
	The Homotopy and Excision Properties	62
	Excision and adjoining cells to a space	63
	Equivalence of singular and simplicial homology	65
	Homeomorphism types of spheres and Euclidean spaces	65
3.	Computations	67
	Betti numbers and torsion coefficients	67
	Cellular homology	68
	Convex linear cells	69
	Rational homology	71
	Euler characteristics and Euler's Formula	73
4.	Proofs of homotopy invariance and excision	75
	Homotopy invariance	75
	Barycentric subdivision of singular chains	76
	Small singular chains	77
	Application to Excision	78
	Mayer-Vietoris sequences	78
5.	Homology and the fundamental group	80
