Chapter 1 The Algebra of the Real Numbers 1

1.1	Introduction	1
1.2	Addition and multiplication of real numbers	1
1.3	Fields	10
1.4	The ordering of the real numbers	12
1.5	Order relations and ordered fields	21
1.6	The positive integers and the induction principle	23
1.7	The integers and the rational numbers	28
1.8	The Archimedean postulate; Euclidean completeness	31
1.9	The language and notation of sets	35
1.10	n -fold sums and products; the generalized associative law	37
1.11	The closure of the integers under addition and multiplication	40

Chapter 2 Incidence Geometry in Planes and Space 43

Chapter 3 Distance and Congruence 48

3.1	The idea of a function	48
3.2	The set-theoretic interpretation of functions and relations	53
3.3	The distance function	56
3.4	Betweenness	60
3.5	Segments, rays, angles, and triangles	64
3.6	Congruence of segments	68

Chapter 4 Separation in Planes and Space 72

4.1	Convexity and separation	72
4.2	Incidence theorems based on the plane-separation postulate	76
4.3	Incidence theorems, continued	80
4.4	Convex quadrilaterals	83
4.5	Separation of space by planes	85
4.6	The seven bridges of Königsberg	87
	Leonard Euler	92

Chapter 5 Angular Measure 93**Chapter 6 Congruences Between Triangles 100**

6.1	The idea of a congruence	100
6.2	The basic congruence theorems	104
6.3	Some remarks on terminology	110
6.4	The independence of the SAS postulate	112
6.5	Existence of perpendiculars	114

Chapter 7 Geometric Inequalities 116**Chapter 8 The Euclidean Program: Congruence Without Distance 125**

8.1	The synthetic postulates	125
8.2	The laws of inequalities for segments	128
8.3	Right angles, synthetically considered	132
8.4	The synthetic form of the triangular inequality. Addition of congruence classes	135
8.5	A summary of the differences between the metric and synthetic approaches	137
	Euclid	138
	George David Birkhoff	138

Chapter 9 Three Geometries 139

9.1	Introduction	139
9.2	The Poincaré model for Lobachevskian geometry	140
9.3	The spherical model for Riemannian geometry	144
9.4	Some questions for later investigation	146

Chapter 10 Absolute Plane Geometry 148

10.1	Sufficient conditions for parallelism	148
10.2	The polygonal inequality	151
10.3	Saccheri quadrilaterals	152
10.4	The basic inequality for angle-sums in a triangle	155
10.5	A historical comedy	158

Chapter 11 The Parallel Postulate and Parallel Projection 160

11.1	The uniqueness of parallels	160
11.2	Parallel projections	163
11.3	The comparison theorem	166
11.4	The basic similarity theorem	167

Chapter 12 Similarities Between Triangles 172

12.1	Proportionalities	172
12.2	Similarities between triangles	174
12.3	The Pythagorean theorem	178

Chapter 13 Polygonal Regions and Their Areas 184

13.1	The area postulates	184
13.2	Area theorems for triangles and quadrilaterals	187
13.3	Applications of area theory: a simple proof of the basic similarity theorem	193
13.4	Further applications of area theory: the Pythagorean theorem	195
13.5	A weaker form of the unit postulate A-5	198
13.6	The Euclidean program continued: Equal-area without area	200

Chapter 14 The Construction of an Area Function 203

14.1	The problem	203
14.2	Complexes and their formula areas	204
14.3	Verification of the area postulates for the function α	210

Chapter 15 Perpendicular Lines and Planes in Space 212

15.1	The Basic theorems	212
15.2	Parallel lines and planes in space	218
15.3	The measure of a dihedral angle: perpendicular lines	221

Chapter 16 Circles and Spheres 224

16.1	Basic definitions	224
16.2	Secant and tangent lines. The line-circle theorem	225
16.3	Secant and tangent planes	229
16.4	Arcs of circles	231
16.5	The two-circle theorem	237

Chapter 17 Cartesian Coordinate Systems 243

René Descartes	249
----------------	-----

Chapter 18 Rigid Motion 251

18.1	The most general concept of congruence	251
18.2	Isometries between triangles	254
18.3	General properties of isometries. Reflections	257
18.4	Dilations and similarities	261

Chapter 19 Constructions with Ruler and Compass 264

19.1	Unmarked rulers and collapsible compasses	264
19.2	How to do algebra with ruler and compass	268
19.3	Solving equations with ruler and compass	271
19.4	The problem of Apollonius	275
19.5	The impossible construction problems of antiquity	278
19.6	The surd field	279
19.7	The surd plane	282
19.8	Quadratic extension of fields. Conjugates in a quadratic extension field	283
19.9	Surd fields of order n ; surds of order n	288
19.10	Applications to cubic equations with rational coefficients	289
19.11	The trisection of the angle	291
19.12	The duplication of the cube	294

Chapter 20 From Eudoxus to Dedekind 295

20.1	Proportionalities without numbers	295
20.2	Eudoxus' synthetic definition of proportionality	297
20.3	The algebra of segment addition	301
20.4	How to define ratios: the supremum	303
20.5	Proof of the addition theorem	307
20.6	The metrization theorem	313
20.7	The Dedekind cut	318

Chapter 21 Length and Plane Area 320

21.1	The definition of arc length	320
21.2	The existence of π	322
21.3	Limits as the mesh approaches zero	325
21.4	The addition theorem for arc length	328
21.5	Approaching the area of a circular sector from below	330
21.6	Approaching the area of a circular sector from above	333
21.7	The area of a sector	335

Chapter 22 Jordan Measure in the Plane 336

22.1	The basic definition	336
22.2	The class of measurable sets	339
22.3	Areas under the graphs of continuous functions	348

Chapter 23 Solid Mensuration: The Elementary Theory 352

23.1	Basic assumptions for the theory of volume	352
23.2	Cross sections of cones and pyramids	354
23.3	Prisms and cylinders	358
23.4	Volumes of prisms and cylinders	360

23.5	Volumes of pyramids and cones	363
23.6	The volume of a sphere	366

Chapter 24 Hyperbolic Geometry 370

24.1	Absolute geometry, continued: the critical function	370
24.2	Absolute geometry: open triangles and critically parallel rays	376
24.3	Hyperbolic geometry: closed triangles and angle sums	382
24.4	Hyperbolic geometry: the defect of a triangle and the collapse of similarity theory	386
24.5	Absolute geometry: triangulations and subdivisions	389
24.6	Euclidean geometry: Bolyai's theorem	394
24.7	Hyperbolic area-theory: the defect of a polygonal region	398
24.8	Bolyai's theorem for triangles in the hyperbolic case	401
24.9	Defects of small triangles	405
24.10	The continuity of the defect	407
24.11	Bolyai's theorem for polygonal regions in the hyperbolic case	410
24.12	The impossibility of Euclidean area-theory in hyperbolic geometry	411
24.13	The uniqueness of hyperbolic area theory	413
24.14	Alternative forms of the parallel postulate Nikolai Ivanovitch Lobachevsky	415 416

Chapter 25 The Consistency of the Hyperbolic Postulates 417

25.1	Introduction	417
25.2	Inversions of a punctured plane	417
25.3	Preservation of the cross ratio under inversions	422
25.4	Preservation of angular measure under inversions	423
25.5	Reflections across L-lines in the Poincaré model	427
25.6	Uniqueness of the L-line through two points	429
25.7	The ruler postulate, betweenness and plane separation	431
25.8	Angular measure in the Poincaré model	435
25.9	The SAS postulate	435

Chapter 26 The Consistency of Euclidean Geometry 438

26.1	Introduction	438
26.2	The ruler postulate	439
26.3	Incidence and parallelism	440
26.4	Translations and rotations	442
26.5	Plane separation	447
26.6	Angle congruences David Hilbert	449 454

Chapter 27 The Postulational Method		455
27.1	Introduction	455
27.2	Postulates considered as self-evident truths	455
27.3	Categoric postulate sets	457
27.4	The use of postulate sets as codifications	460
27.5	The use of postulates to keep the record straight	461
Chapter 28 The Theory of Numbers		462
Chapter 29 The Theory of Equations		469
Chapter 30 Limits of Sequences		474
Chapter 31 Countable and Uncountable Sets		479
31.1	Finite and countable sets	479
31.2	The countability of the surd field	482
31.3	Proof that real numbers are uncountable	482
Chapter 32 An Order Field That Is Euclidean but Not Archimedean		485
	Index	497
