

## Basic Similarity Theorems

AA similarity - done

SAS similarity Given  $\triangle ABC \neq \triangle DEF$  so  
 $\frac{|AB|}{|BC|} = \frac{|DE|}{|EF|}$  &  $\angle ABC = \angle DEF$ , then

$$\triangle ABC \sim \triangle DEF.$$

Proof. Have  $\frac{|AB|}{|DE|} = \frac{|BC|}{|EF|} = \frac{1}{r}$ . May as well  
 assume  $r \geq 1$  (reverse roles of  $\triangle ABC$  &  $\triangle DEF$   
 if ratio  $\leq 1$ ). Use result at end of L7 to

find  $\triangle GHK$  so  $\triangle ABC \sim \triangle GHK$   
 with ratio  $r$ . Then  $|GH| = r|AB| = |DE|$

$|HK| = r|BC| = |EF|$  &  $\angle GHK = \angle ABC = \angle DEF$   
 $\Rightarrow \triangle GHK \cong \triangle DEF$  by SAS congruence.

Since  $\triangle ABC \sim \triangle GHK \cong \triangle DEF$ , conclude  
 $\triangle ABC \sim \triangle DEF$ .

SSS similarity  $\triangle ABC \neq \triangle DEF$  so that

$\frac{|DE|}{|AB|} = \frac{|EF|}{|BC|} = \frac{|DF|}{|AC|} = r$ , then  $\triangle ABC \sim \triangle DEF$ .

Proof. Similar to previous one.

Find  $\Delta GHK$  so  $\Delta ABC \sim \Delta GHK$  ratio  $r$ .

Then  $|GH| = r|AB| = |DE|$ ,  $|HK| = r|BC| = |EF|$ ,

$|GK| = r|AC| = |DF| \Rightarrow \Delta GHK \cong \Delta DEF$

by SSS congruence, so  $\Delta ABC \sim \Delta GHK \cong$

$\Delta DEF \Rightarrow \Delta ABC \sim \Delta DEF$ .

Derivation of Pythagorean Thm.

$X \in (AB)$  since  
 $|\angle CAB|, |\angle CBA| < 90^\circ$

$$c = |AB|, b = |AC|, a = |BC|$$

$$h = |CX| \quad u = |AX|, \text{ so } c - u = |BX|.$$

Theorem (i)  $\Delta AXC \sim \Delta ACB$  and

$$\Delta BXC \sim \Delta BCA$$

$$(ii) h^2 = u(c - u)$$

$$(iii) \text{ PYTHAGOREAN THM. } c^2 = a^2 + b^2$$

Proof (i)  $\angle AXC = \angle ACB = 90^\circ$  and  
 $\angle CAB = \angle XAC$ , so  $\triangle AXC \sim \triangle ACB$ . Switch  
 roles of A & B to get second conclusion.

(ii) Since  $\triangle AXC \sim \triangle CXB$  we have

$$\frac{u}{h} = \frac{h}{c-u} \quad \text{or} \quad h^2 = u(c-u).$$

(iii) By preceding, have

$$\frac{u}{b} = \frac{b}{c} \quad \& \quad \frac{a}{c} = \frac{c-u}{a} \quad \text{so}$$

$$u = \frac{b^2}{c} \quad \text{and} \quad c-u = \frac{a^2}{c}. \quad \text{Add to get}$$

$$c = u + (c-u) = \frac{a^2 + b^2}{c} \quad \text{or} \quad c^2 = a^2 + b^2.$$

One use of similarity to discover nonobvious fact:

Given  $\triangle ABC$ , let  $D \in (AC)$  so that  
 $\angle BDC$  bisects  $\angle ABC$ . Then

$$\frac{|AB|}{|BC|} = \frac{|AD|}{|DC|}.$$

Proof.

Let  $E$  be so  $E \in B \times C$  and  $|EB| = |AB|$   
 $(\Rightarrow |EC| = |AB| + |BC|)$ . By a prev. thm,

$\therefore BD \parallel AE$  and hence

$$\frac{|BC|}{|DC|} = \frac{|EB|}{|AD|} = \frac{|AB|}{|AD|} \text{ or equiv.}$$

$$\frac{|BC|}{|AB|} = \frac{|DC|}{|AD|} \text{ or } \frac{|AB|}{|BC|} = \frac{|AD|}{|DC|}$$

## 2D Cartesian Coordinates

There is a 1-1 correspondence  $P(\text{plane}) \rightarrow \mathbb{R}^2$   
 $A \rightarrow (x(A), y(A))$

so that  $|AB| =$

$$\sqrt{(x(A) - x(B))^2 + (y(A) - y(B))^2}$$

Proof. Take any pair of  $\perp$  lines

$L \neq M$ .

$f \neq g$   
 ruler funcs so if

$Z \in L \cap M$  then  $f(Z) = g(Z) = 0$

Get  $x$  &  $y$   
 from ruler  
 funcs +  $\perp$   
 proj

Map is 1-1 Say  $(x(A), y(A)) = (x(B), y(B))$ .

$x(A) = x(B)$  means feet of  $L$  to  $L$  at

$A$  &  $B$  are same  $\Rightarrow$  same  $\perp$  line  $M'$ .

Likewise  $y(A) = y(B) \Rightarrow A$  &  $B$  on same line  $L' (\perp M)$ .

Now  $L' \perp M'$ ; for  $M' \parallel L \Rightarrow M \perp L \Rightarrow$

$M' \perp L$ , and  $L' \parallel L \Rightarrow L' \perp M$ .

Now  $L' \cap M' = \text{point}$ , so  $A = B$  in  $L' \cap M'$ .

Map is onto Given  $(u, v) \in \mathbb{R}^2$ . Let

$U \leftrightarrow u$  on  $L$ ,  $V \leftrightarrow v$  on  $M$ .

$M' \perp L$  at  $U$ ,  $L' \perp M$  at  $V$ . Again,

$L' \perp M'$  and if  $A \in L' \cap M'$ , then it maps to  $(u, v) \in \mathbb{R}^2$ .

Distance interpretation

Application

of  
Pythag.  
Thm.

Actually 3 cases

(I+II)

$$x(A) = x(B) \text{ or } y(A) = y(B)$$

$$A = C \quad B = C$$

$$|AB| =$$

$$|y(A) - y(B)| \text{ or}$$

$$|x(A) - x(B)| \text{ resp.}$$

(opp sides rectangle)  
or identical segts

(III)  $x(A) \neq x(B)$  and  $y(A) \neq y(B)$ .

Let  $C \in L'(A) \cap M'(A)$ . By Pythag Thm.

$$|AB| = \sqrt{|AC|^2 + |BC|^2} \quad \text{Using rectangles}$$

See that  $|AC|^2 = (x(A) - x(B))^2$  and

$$|BC|^2 = (y(A) - y(B))^2.$$

Angle measure is much tougher to study

Moise sidesteps the issue. One approach — Develop plane trigonometry along lines of this course all the way to the Law of Cosines.

3D coordinates

corresponds

to  $(x(A), y(A), z(A))$

Need a 3D Pythagorean Thm.

will outline.

What is  
 $|AG|$ ?

Edges  $\perp$  faces  $\rightarrow$  every line through common point on face is  $\perp$  edge.

$$\text{Then } |AC|^2 = |AB|^2 + |BC|^2$$

But  $AC \perp CG$  too, so

$$|AC|^2 + |CG|^2 = |AG|^2$$

$$\text{Combining, } |AB|^2 + |BC|^2 + |CG|^2 = |AG|^2.$$

How much choice in defining coords.?

$A, B, C \in$  plane non collinear.

Can choose so that  $A \leftrightarrow (0, 0)$

$B \leftrightarrow (u, 0), u > 0$

$C \leftrightarrow (x, y), y > 0.$

Likewise in 3-dims for  $A, B, C, D$  not coplanar.
