# Detailed Table of Contents

<b>Preface</b> .....	1
Comments on the texts.....	2
Some additional references.....	2
<b>Prerequisites</b> .....	4
Set theory.....	4
Topology.....	4
Algebra.....	5
Analysis.....	5
Category theory.....	6
<b>I. Further Properties of Covering Spaces</b> .....	8
0. Introduction.....	8
1. Lifting criterion.....	15
Recognizing simply connected coverings.....	17
Change of basepoints in covering spaces.....	17
2. Covering space transformations.....	17
3. Universal coverings and applications.....	19
Simply connected covering spaces.....	19
Recognizing Hausdorff quotients.....	20
Covering spaces realizing subgroups of $\pi_1$ .....	21
<b>II. Computing Fundamental Groups</b> .....	23
1. Orbit spaces.....	23
Generalities.....	23
Some important examples.....	24
2. Amalgamation constructions for groups.....	25
3. The Seifert-van Kampen Theorem.....	25
4. Examples.....	25
<b>III. Graph complexes</b> .....	26
1. Basic definitions.....	26
An alternate definition.....	27
Subgraphs.....	27
Connectedness.....	28
Further topological properties of graphs.....	29
<i>Addendum:</i> Embedding graphs in $\mathbb{R}^3$ .....	30
2. Maximal trees.....	32
3. Fundamental groups of graphs.....	34
The Euler characteristic of a graph.....	36
4. Finite coverings of graphs.....	38
5. Infinite graphs.....	40

IV.	<b>Prelude to homology theory</b> .....	41
1.	Algebraic chains for graphs .....	41
	The Königsberg Bridge Problem .....	43
2.	Triangulations and simplicial complexes .....	44
	Barycentric coordinates .....	45
	Polyhedra and simplicial complexes .....	47
	Decompositions of prisms .....	48
3.	Chain complexes and exact sequences .....	52
	The chain complex of a 2-dimensional simplicial complex .....	52
	Green's Theorem and 2-dimensional chains .....	54
	The algebraic framework for homology .....	55
	Examples of exact sequences .....	55
	Graded objects .....	56
	Abstract chain complexes .....	57
V.	<b>Simplicial chain complexes and homology</b> .....	59
1.	Simplicial chains and homology .....	59
	Basic facts about abstract homology groups .....	60
	Chain complexes associated to simplicial complexes .....	61
2.	Examples and special cases .....	62
	Acyclic complexes .....	63
3.	Relative groups and exactness properties .....	66
	Application to simplicial complexes .....	67
	The Five Lemma .....	69
4.	Computational techniques .....	69
	Excision for simplicial homology .....	70
	Simplicial Mayer-Vietoris sequences .....	71
5.	Is homology topologically invariant? .....	72
VI.	<b>Axiomatic singular homology</b> .....	73
1.	Primitive data and basic axioms .....	74
	The data for an abstract singular homology theory .....	74
	Functoriality and naturality .....	75
2.	Exactness, homotopy invariance and support properties .....	77
	Exactness .....	77
	Homotopy invariance .....	78
	Compact supports and polyhedral generation .....	79
3.	Normalization properties .....	80
4.	Excision and Mayer-Vietoris sequences .....	82
5.	Existence and uniqueness theorems .....	83

VII. <b>Some elementary applications</b> .....	84
1. Consequences of the axioms .....	84
Semi-explicit homeomorphisms of various convex sets .....	84
Some nonhomeomorphic spaces .....	85
Local homology at a point .....	86
Application to graphs .....	86
Further nonhomeomorphism theorems .....	88
2. Nonretraction and fixed point theorems .....	89
The Brouwer Fixed Point Theorem .....	89
An application to matrices with nonnegative entries .....	89
3. Separation and invariance theorems .....	90
The Jordan-Brouwer Separation Theorem .....	92
4. Nonplanar graphs .....	95
The utilities network .....	96
The complete graph on 5 vertices .....	98
Kuratowski's Theorem .....	100
5. Rationalizations of abelian groups .....	100
Modules of quotients .....	100
Application to homology theories .....	102
6. Cell decompositions and Euler's Formula .....	103
Regular cell complexes .....	103
Homology and cell attachment .....	104
Euler characteristics .....	105

(107 pages)
